Email angela.stangarone@mssm.edu

CIRCLES - A Longitudinal Study

Collaborative International Research in Clinical and Longitudinal Experience in NMO Studies

The purpose of the CIRCLES study is to create a biorepository containing longitudinally-collected data and bio samples from subjects with NMO and control subjects. The data and bio samples will be available to researchers to better understand NMO pathogenesis, clinical course, and impact of therapy.

Results of these studies may identify the etiology and risk factors, biomarkers for disease progression, and treatment outcomes to guide development of novel therapies. Findings may also facilitate future research and clinical trials to investigate specific hypotheses related to NMO and to improve the lives of individuals suffering from NMO.
